

Table 3. Adverse Events			
Year	Study / guidance	Population	Main relevance
2010	ACCORD BP	Type 2 diabetes	SBP <120 vs <140 did not significantly lower composite CV outcome; underpowered for BP question.
2015/2021	SPRINT	High-risk adults without diabetes	Intensive SBP target reduced major CV events; diabetes excluded.
2024	ESPRIT	High CV-risk patients with/without diabetes	SBP <120 strategy reduced major vascular events overall; diabetes subgroup not definitive.
2025	BPROAD	Type 2 diabetes, high CV risk	Direct large RCT in diabetes: HR 0.79 for primary composite.
2025-2026	AHA/ACC and ADA guidance	Hypertension / diabetes care	Trend toward tighter targets for high-risk patients, with individualization and monitoring.
§ CKD development			
Incident albuminuria			
* Patients were counted only once for hypothesis testing. CKD was defined as a doubling of serum creatinine, hospitalization, or were important medical events that investigators judged to represent substantial hazards or harm to research participants.			
‡ Conditions of interest were a selected list of events that were serious adverse events or led to an emergency department visit.			
§ Data were missing for 184 patients in the intensive-treatment group and 187 patients in the standard-treatment group.
